

How far did your group get?

- We all finished the floral plots and were starting to work on the “Try other variables or datasets” section.

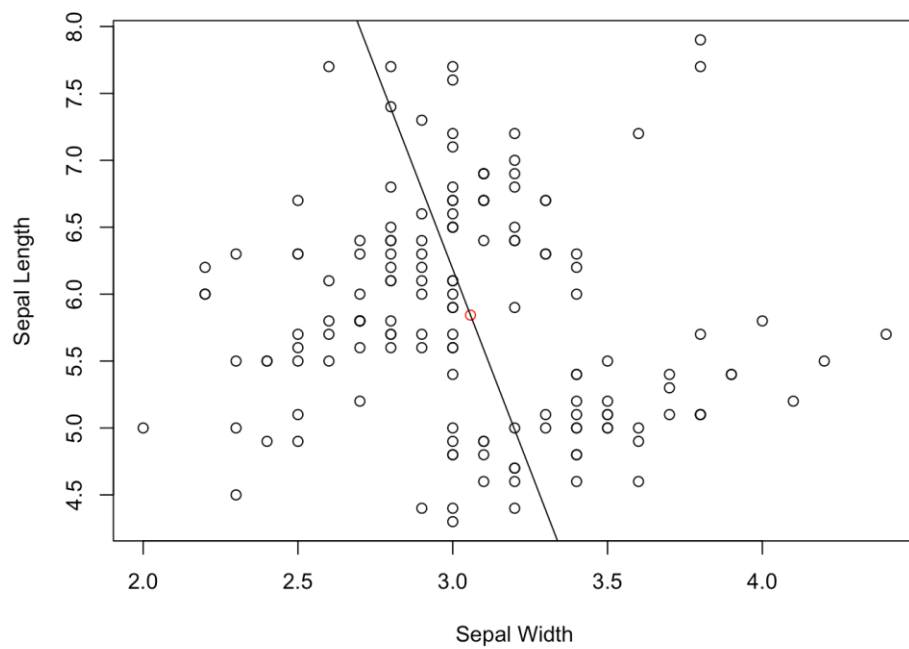

What parts of the exercise were difficult, or too easy?

- The part that gave our whole group the most trouble was editing the plot function to redraw the line. The process of copying and pasting while maintaining the important parts of the structure and not mucking up the punctuation. It took a lot of discussion and working together to find what each person was doing wrong (we were all messing up in unique ways!).
- We also struggled a bit with adding the title and changing the axis labels, as it was not explicitly explained. Luckily, trial and error prevailed, and Brian and Ollie figured it out and showed everyone else how to do it.
- We all had an easy time with the first few sections—pulling in the data set and creating the initial plot.

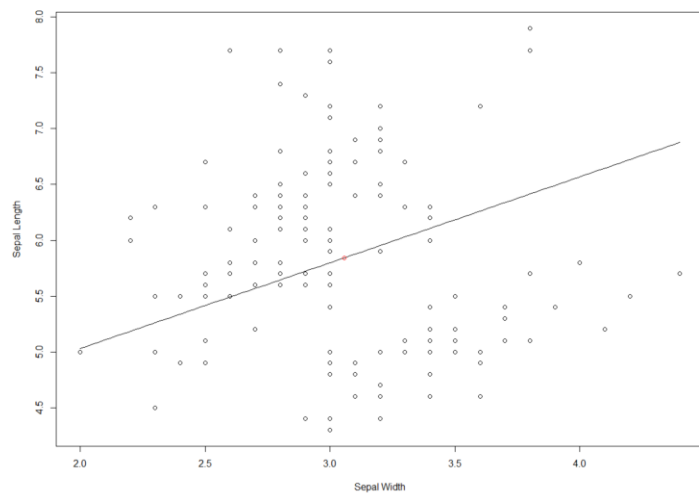

Upload at least one figure or screenshot from work and explain

- We each uploaded a screenshot of our final floral plot and line. Each shows a titled plot with a red point denoting the mean location of the x and y coordinates of the data set, and a line through that point with a slope that was defined in the R function.
